Principle 6

Principle 6:
The ocean and humans are inextricably interconnected.

Use of the Ocean

A.
The ocean is essential to the existence of human life on Earth.

A.1.
The ocean has an incredible array of renewable and non-renewable resources that humans use.

A.2.
Technology has enabled marine fisheries and aquaculture to produce increased amounts of food for humans.

A.3.
The ocean provides most of the fresh water on Earth, and photosynthetic organisms in the ocean provide most of the oxygen on Earth.

A.4.
Many of our medicines, chemicals (e.g., salt), and food products are extracted or derived from a variety of ocean life, including bacteria, algae, sponges, and fish products.

A.5.
Energy resources and raw materials are extracted from the sea floor, including mineral ores, crude oil, and natural gas.

A.6.
Increased human population, and thus increased demand for resources, as well as improved technology, are having environmental, social, and ecological implications on the ocean.

Where People Live

B.
People choose to live in coastal areas for many reasons.

B.1.
The ocean is a continuous body of water connecting all the land masses, which in turn facilitates exploration, transportation, and commerce.

B.3.
Coastal areas provide moderate weather and climate.

B.4.
Coastal areas provide opportunities for recreation, inspiration, and rejuvenation.

B.5.
Coastal areas are a source for cultural heritage.

B.6.
Cultural exchange has occurred, and continues to occur, as ships carry people across the ocean.

B.2.
The ocean supports the global economy and offers a host of opportunities for careers in commercial realms, recreation, and scientific research.

Weather Impacts People

C.
Changes in the current patterns in the ocean can affect climate and weather.

C.1
Changes in the weather and climate affect biodiversity, migration patterns, and fisheries, which may also adversely affect people.

C.2.
Hurricanes, typhoons, tsunamis, and the rising sea level may adversely affect humans living along or near the coastline.

C.3.
More effective global communication can provide warning to cities and remote areas, allowing sufficient time to minimize the effects of natural disasters on human populations.

Human Impact on the Ocean and Atmosphere

D.
The exponential growth of human populations, together with technological advances, have exacerbated changes in the ocean and atmosphere.

D.1.
Human activity contributes to global climate change.

D.7.
Humans contribute to some of the topographical changes of areas, such as beaches, bays, wetlands, the sea floor, and coral reefs.

D.11.
Humans contribute to biological changes of ocean ecosystems.

D.15.
Humans contribute to biochemical changes in ocean ecosystems.

D.2.
Activities such as burning fossil fuels, the decay of organic waste in landfills and the emission of hydrofluorocarbons in industrial processes input more greenhouse gases into the atmosphere than are being removed (i.e., being absorbed into the ocean, or taken up by trees).

D.4.
Human actions have increased the effect of natural hazards.

D.8.
Topography is altered by activities such as blast fishing, the construction of dams, jetties and landfills, and the drainage of wetlands.

D.9.
The deliberate alteration of the ocean and/or terrestrial topography can have negative impacts on marine ecosystems.

D.12.
Ocean ecosystems are altered by activities that change symbiotic and predator/prey relationships.

D.3.
Thermal expansion of water and melting ice caps raises the sea level, which could displace a large fraction of the world's coastal populations and cause changes in ocean current patterns, affecting climate.

D.5.
These human actions have increased the effects of storm surges, and the intensity and number of hurricanes and tsunamis.

D.6.
These human actions have intensified the effects of forest fires and droughts inland.

D.10.
Some of these impacts include sedimentation that block coral growth, the loss of essential fish habitats, the disruption of migration routes, and loss of breeding and nesting areas for marine mammals, birds, and turtles.

D.13.
Activities, such as the introduction of invasive species through bilge water, aquarium trade, and poorly managed aquaculture and fisheries alter predator/prey relationships, which destabilizes food webs and leads to a loss of biodiversity.

D.14
Human activities that increase ocean temperature disrupt relationships between organisms, such as symbiotic relationships between coral and zooxanthellae.

D.16.
Increased carbon emissions into the atmosphere from factories and automobiles lead to increased carbon dioxide uptake by the ocean. This process results in a decrease of pH of ocean water, known as ocean acidification, and leads to changes in organisms and ecosystems, such as shell thinning and disrupting food webs.

D.17.
Biomagnification of toxic substances leads to the decreased fitness of organisms, which disrupts ecosystems.

D.18.
Activities, such as the use of nitrogen-based fertilizer, the improper disposal of pet waste and use of phosphorous-containing detergents, can dramatically impact the biological health of coastal ecosystems (e.g., phosphorous build up, eutrophication, and algal blooms).

D.19.
Rapid growth of some algae and dinoflagellates is responsible for the poisoning of marine birds, mammals, and humans, as well as the smothering of coral.

Responsibility and Advocacy for the Ocean

E.
Achieving sustainability of the diverse ecosystems and resources in the ocean depends upon collective and individual action based on scientific research and exploration.

E.1.
The ocean historically has been seen as a common area: an inexhaustible resource exploited by many, but protected by no one.

E.2.
Planning and action on a global, regional, and local level can result in enforceable regulations, laws, and accords aimed toward environmental sustainability.

E.3.
Many marine resources are renewable with protection, regulation, education, and support for the ocean.

E.4.
There are laws that establish protected areas such as Marine Protected Areas and marine reserves.

E.5.
There are state and federal laws that regulate activities such as fishing, polluting, dumping sewage, emitting air pollutants and oil drilling.

E.6.
It is important for the public to understand the issues regarding the ocean and to take action.

E.7.
Mass education about the ocean (e.g., through the media, and both formal and informal means) can help people understand the relevance of the ocean to their own lives and future, and that of future generations.

E.9.
Education helps people understand the impact of their personal choices in order to make informed decisions.

E.14.
Concerned citizens, including young people, can form community groups on a grassroots level to educate, conserve, and restore coastal and marine habitats.

E.8.
There are programs that offer consumer information about sustainably harvested seafood and other marine products.

E.10.
Air pollution and excess greenhouse gases can be reduced through simple actions, such as turning off electronics to use less electricity, walking, and biking instead of driving, carefully sealing and insulating homes, and using energy efficient appliances and light bulbs.

E.11.
Biological and biochemical changes can be reduced through actions, such as eliminating the input of chemicals and other pollutants into our watersheds, not dumping into storm drains, not littering, using phosphorous-free detergents and investing in biodegradeable household, and gardening products.

E.12.
Overfishing and the destruction of marine habitats can be reduced through actions, such as only buying and eating sustainably caught seafood and by respecting No Take Marine Protected Areas.

E.13.
Compliance with regulations and laws concerning the protection of the ocean is a vital part of conserving marine resources.
